

OUR PROMISE OF QUALITY

At P&L Fertilizer we purchase only the purest raw products available on the market. Our fertilizer contains significantly low amounts of heavy metals, particularly aluminum. Aluminum can be detrimental to the plant by stunting and limiting root development, furthermore reducing the plants ability to absorb vital nutrients and water. Aluminum also forms a compound in the soil that can tie up the available phosphorus in the soil, keeping it from getting into the plant.

We strive here at P&L to maintain the purest product on the market, all while keeping our products financially reasonable to farmers.

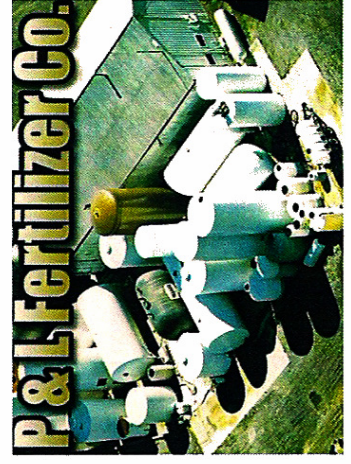

P & L FERTILIZER

Manufacturing Quality 100% OrthoPhosphate

Liquid POP-UP and FOLIAR Fertilizer

For Corn, Soybeans and Wheat for over 45 years

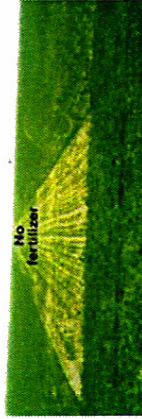

- ★ PLACE DIRECTLY ON THE SEED
- ★ GREAT FOLIAR PROGRAMS
- ★ 2X2 ALTERNATIVE TO 10-34-0

OUR PHILOSOPHY

For over 45 years **P&L Fertilizer** has been in the business of **100% Ortho-Phosphate** fertilizer manufacturing. Our liquid fertilizer can be placed directly on the seed without the risk of burning or impeding germination. Using it on our own farm, we feel that directly on the seed is the **most ideal placement** for fertilizer, being that the plant will not need to seek out the fertilizer. Our ortho-phosphate solution is **available immediately**, making it ideal for early planting in cooler soils. With much smaller suggested rates (4-7 gallons), farmers are handling much less product than with most poly-phosphate (10-34-0) fertilizer. We offer a full line of micronutrient products that can be mixed directly with our fertilizer providing the essential micronutrients that are often times left out. Our products also make a great **foliar program** that give the plant a much needed boost at multiple times throughout the growing season to optimize yield. Our fertilizer is non-corrosive and does not freeze, therefore being able to be kept in the planter or sprayer at the end of the year and utilized as a winterizing product.

OUR PRODUCTS

3-20-15

Our top yielding and most popular analysis, 3-20-15 has the almost perfect separation of P and K, not allowing them to bind one another up like in equal P and K analyses. (Pop-up or Foliar)

9-18-9

Another good analysis, 9-18-9 provides more nitrogen at planting time, making the rush for sidedressing a little less hectic. (Pop-up or foliar)

3-18-18

A traditional pop-up and foliar analysis, we feel that 3-18-18 is still a good one, but a little too close together with the P and K to compete with our 3-20-15. (Pop-up or foliar)

9-25-4

Our 9-25-4 is 65% Ortho and 35% Poly and mixes readily with 28% Nitrogen. This blend is perfect for 2x2 placement and is a perfect alternative for 10-34-0 users at a time when 10-34-0 is hard to find and sometimes subject to dirty product. With reduced rates, it is economically more feasible. (Pop-up or foliar)

CUSTOM BLENDS AVAILABLE

We can also custom mix blends to suit the customer's wants and needs.

LIQUID SUGAR

We make our own liquid sugar product that easily mixes with our fertilizer to help ward off insects that cannot digest sugars and to help raise the sugar level in the plant which is essential for nutrient uptake.

0-0-25-17s

Our 0-0-25-17s product offered at P&L offers added potassium for soils that may be depleted. This is able to be mixed with most fertilizers and can be foliar applied or mixed with pop-up and sidedress to achieve optimum potassium levels with a kick of sulfur.

CHELATED MICRO-NUTRIENTS

Our pop-up and foliar program offers the farmer a perfect opportunity to get much needed micronutrients to the plant. We offer chelated Zinc, Manganese, Magnesium, Calcium, Boron, Copper and others to help suit the plants micro-nutrient needs by way of soil applied or foliar applied.

WE ARE ALSO PROUD DEALERS OF

DeltAg formulates a full line of biostimulant, nutrient, and micronutrient products to aid applied fertilizer efficiency and improve crop response to nutrients.

PERCPLUS

PercPlus is designed to be applied to growing plants to enhance root development, growth, overall plant health and build tolerance to stress. PercPlus can be applied in furrow, foliar, sidedressed, with glyphosate and in conjunction with many of P&L's fertilizer products to get optimum performance.

SEED COAT

Seed Coat is specifically designed to give young plants more energy to get out of the ground and growing. A talc-like substance, many farmers use Seed Coat to replace powdered graphite, getting benefits out of something needed anyway.

CROPKARB

CropKarb is designed to enhance bloom set and fruit sizing or bulking. CropKarb works by delivering the necessary plant chemical catalysts, as well as a supplemental mobile carbon source to the fruiting portion of your crop.

MICROVITE

MicroVite is designed to use when you need several nutrients and want the convenience of a combination product.

NUTRIENTS AND MICRONUTRIENTS

DeltAg also offers a line of nutrient and micro nutrient products that can be utilized when a particular nutrient or micronutrient is lacking. NutriK, Calcium Plus, Magnesium Plus, Sulfur Plus (great replacement for thiosul), Boron Plus, Copper Plus, Iron Plus, Zinc Plus, and Manganese Plus (helps where glyphosate has blocked manganese metabolism) are all available.

SOIL SOLUTION

Soil Solution feeds the bacteria and more bacterial activity means more oxygen, better digestion of old residue, more nutrient availability, more water holding capacity, and better yields.
